

Some people are extremely sensitive to scented products and the slightest perfume fragrance can cause them to have an allergic perfume outbreak. Research has shown that perfumes and fragrances are respiratory irritants and those who have asthma can have adverse reactions to them. Studies also have shown that perfumes may actually be a cause of asthma. Those who are sensitive to perfumes and fragrances can become disabled when exposed to them and they cannot take part in normal activities. We kindly request that everyone refrain from using scented and perfumed products in our facility so that we may safeguard the comfort level of all our clients.
